ANALYSIS OF PRECIPITATION**

INTRODUCTION

Two main equations of hydrology

- ❖ Conservation of mass
- ❖ Conservation of energy

INTRODUCTION TO HYDROLOGY AND ANALYSIS OF PRECIPITATION

1. Annual precipitation in a particular year was measured to be 70 cm over a lake with 200 km² surface area. The mean annual inflow and outflow discharges by the rivers to this lake is given as 1.20 m³/s and 1.27 m³/s, respectively. A 9 cm rise was observed in water level for that year. The leakage from the lake bottom is negligibly small. Considering given data calculate the annual evaporation depth of the lake for that particular year.

Area = 200 km²

Precipitation = 70 cm

Inflow = 1.20 m³/s

Outflow = 1.27 m³/s

$\Delta S = +9$ cm

Evaporation ?

INTRODUCTION TO HYDROLOGY AND ANALYSIS OF PRECIPITATION

$$\text{Precipitation} = 70 \text{ cm} \longrightarrow \text{volume} = 0.70 \cdot 200 \cdot 10^6 = 140 \cdot 10^6 \text{ m}^3$$

$$\text{Inflow} = 1.20 \text{ m}^3/\text{s} \longrightarrow \text{volume} = 1.20 \cdot 365 \cdot 24 \cdot 60 \cdot 60 = 37.84 \cdot 10^6 \text{ m}^3$$

$$\text{Outflow} = 1.27 \text{ m}^3/\text{s} \longrightarrow \text{volume} = 1.27 \cdot 365 \cdot 24 \cdot 60 \cdot 60 = 40 \cdot 10^6 \text{ m}^3$$

$$\Delta S = +9 \text{ cm} \longrightarrow \text{volume} = 0.09 \cdot 200 \cdot 10^6 = 18 \cdot 10^6 \text{ m}^3$$

$$X(\text{inputs}) = \text{Precipitation} + \text{Inflow} = 140 \cdot 10^6 + 37.84 \cdot 10^6 = 177.8 \cdot 10^6$$

$$Y(\text{outputs}) = \text{Outflow} + \text{Evaporation} = 40 \cdot 10^6 + \text{Evaporation}$$

$$\Delta S(\text{accumulation}) = 18 \cdot 10^6 \text{ m}^3$$

$$X - Y = \Delta S$$

$$(177.8 \cdot 10^6) - (40 \cdot 10^6 + \text{Evaporation}) = 18 \cdot 10^6 \text{ m}^3$$

$$\text{Evaporation} = 119 \cdot 10^6 \text{ m}^3$$

$$\text{Hevaporation} = (119 \cdot 10^6 \text{ m}^3) / (200 \cdot 10^6) = 0.61 \text{ m}$$

INTRODUCTION TO HYDROLOGY AND ANALYSIS OF PRECIPITATION

2. The reservoir capacity of a small dam constructed to supply water to a nearby town is $14 \times 10^6 \text{ m}^3$. At the beginning of February there is $8 \times 10^6 \text{ m}^3$ water in the reservoir. The precipitation and evaporation depths for this month are given as 120 mm and 35 mm, respectively. The inflow during February is $6.7 \times 10^6 \text{ m}^3$, and water demand of the town is $0.18 \times 10^6 \text{ m}^3$. If the surface area of the reservoir is 1.1 km^2 , calculate the water volume that is to be spilled from the dam for February after the water demand of the town is supplied.

$$\text{Area} = 1.1 \text{ km}^2$$

$$\text{Precipitation} = 120 \text{ mm}$$

$$\text{Evaporation} = 35 \text{ mm}$$

$$\text{Inflow} = 6.7 \times 10^6 \text{ m}^3$$

$$\text{Demand} = 0.18 \times 10^6 \text{ m}^3$$

Spill ?

INTRODUCTION TO HYDROLOGY AND ANALYSIS OF PRECIPITATION

Precipitation = 120 mm

$$\text{volume} = 0.120 \cdot 1.1 \cdot 10^6 = 0.132 \cdot 10^6 \text{ m}^3$$

Evaporation = 35 mm \longrightarrow

$$\text{volume} = 0.035 \cdot 1.1 \cdot 10^6 = 0.04 \cdot 10^6 \text{ m}^3$$

Inflow = $6.7 \cdot 10^6 \text{ m}^3$ \longrightarrow

Demand = $0.18 \cdot 10^6 \text{ m}^3$

$$X(\text{inputs}) = \text{Precipitation} + \text{Inflow} = 0.132 \cdot 10^6 + 6.7 \cdot 10^6 = 6.83 \cdot 10^6 \text{ m}^3$$

$$Y(\text{outputs}) = \text{Evaporation} + \text{Demand} = 0.04 \cdot 10^6 + 0.18 \cdot 10^6 = 0.22 \cdot 10^6 \text{ m}^3$$

$$X - Y = \Delta S$$

$$(6.83 \cdot 10^6) - (0.22 \cdot 10^6) = 6.61 \cdot 10^6 \text{ m}^3 \text{ water accumulated.}$$

At the beginning there is $8 \cdot 10^6 \text{ m}^3$ water in the reservoir so at the end of the month there will be $8 \cdot 10^6 + 6.61 \cdot 10^6 = 14.61 \cdot 10^6 \text{ m}^3$

Reservoir capacity is $14 \cdot 10^6 \text{ m}^3$ therefore $0.61 \cdot 10^6 \text{ m}^3$ water should be spilled.

INTRODUCTION TO HYDROLOGY AND ANALYSIS OF PRECIPITATION

6. Radiation reaching the surface of earth is 45 when the radiation from the sun at the outer edge of the atmosphere is taken as 100. Long wave radiation from the earth to the atmosphere is 104, long wave from the earth directly to the space is 15. Atmosphere reflects 98 of the long wave radiation back to earth. The daily average energy coming from the sun is 680 cal/cm^2 at the outer edge of the atmosphere. Find the energy used in evaporation and annual depth of evaporation.

$$H_x = (45 + 98) / 100$$

$$H_y = (104 + 15) / 100$$

$$H_x - H_y = \Delta H$$

$$\Delta H = \frac{(45 + 98) - (104 + 15)}{100} = 0.24$$

Annual energy for evaporation is $365 * 0.24 * 680 = 59570 \text{ cal/cm}^2$

Heat of vaporization for water is 590 cal/cm^3 then annual evaporation depth $59570 / 590 = 101 \text{ cm}$

INTRODUCTION TO HYDROLOGY AND ANALYSIS OF PRECIPITATION

6. P1 precipitation gage has recorded the reading below during a storm. Accordingly
- Draw the curve which shows the variation of total precipitation with respect to time.
 - Draw the curve showing the variation of precipitation intensity time (hyetograph).

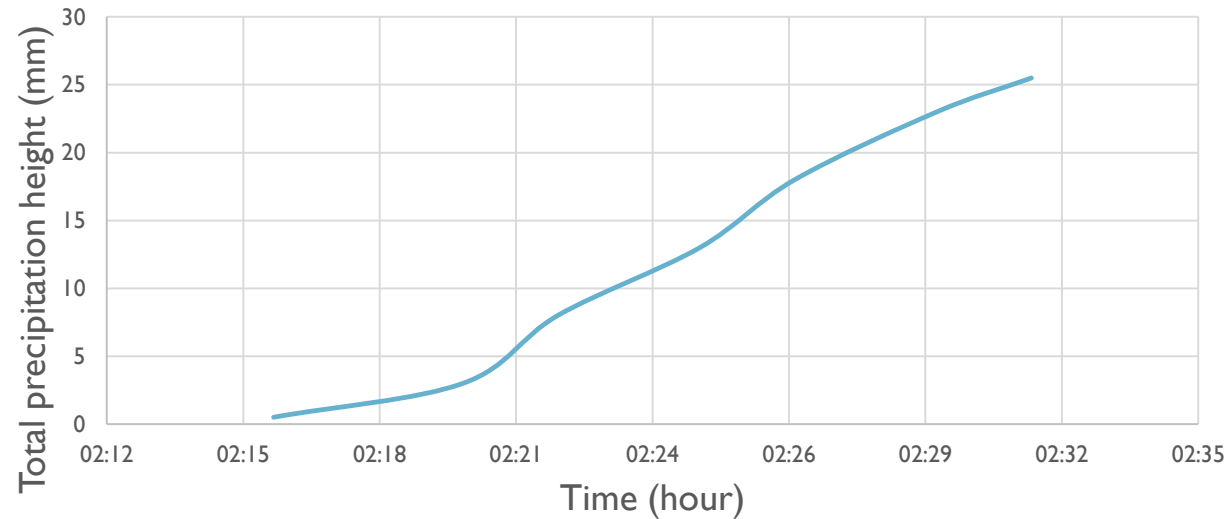

Time	02:16	02:20	02:22	02:25	02:27	02:30	02:32
Total Precipitation (mm)	0.5	3.0	8.0	13.0	18.0	23.0	25.5

INTRODUCTION TO HYDROLOGY AND ANALYSIS OF PRECIPITATION

a) Draw the curve which shows the variation of total precipitation with respect to time.

Time	02:16	02:20	02:22	02:25	02:27	02:30	02:32
Total Precipitation (mm)	0.5	3.0	8.0	13.0	18.0	23.0	25.5

Total precipitation-Time curve

INTRODUCTION TO HYDROLOGY AND ANALYSIS OF PRECIPITATION

b) Draw the curve showing the variation of precipitation intensity time (hyetograph).

t(saat)	P (mm)	Δt (dakika)	ΔP (mm)	$i = \Delta P / \Delta t$ (mm/saat)
02:16	0.5	4	2.5	37.5
02:20	3			
02:22	8	2	5	150
02:25	13	3	5	100
02:27	18	2	5	150
02:30	23	3	5	100
02:32	25.5	2	2.5	75
