**Examples –5 Groundwater Flow**

1- a)

$$\begin{aligned}
 t=2 \Rightarrow f &= 10 + (82-10)e^{-0.3 \cdot 2} = 49,5 \text{ mm/hr} \\
 t=4 \Rightarrow f &= 10 + (82-10)e^{-0.3 \cdot 4} = 31,7 \text{ mm/hr} \\
 t=6 \Rightarrow f &= 10 + (82-10)e^{-0.3 \cdot 6} = 21,9 \text{ mm/hr} \\
 t=8 \Rightarrow f &= 10 + (82-10)e^{-0.3 \cdot 8} = 16,53 \text{ mm/hr}
 \end{aligned}$$

$$\text{b) } F_{2-4} = \int_2^4 f dt = \int_2^4 (10 + 72)e^{-0,3t} dt = 10t - \frac{72}{0,3} e^{-0,3t} \Big|_2^4 = 20 - 240(e^{-1,2} - e^{-0,6}) = 79,47 \text{ mm}$$

$$\text{Effective precipitation} = 2 \cdot 70 - 79,47 = 60,53 \text{ mm}$$

$$\text{c) } \Phi = \frac{2 \cdot 70 - 60,53}{4 - 2} = 39,74 \text{ mm}$$

**Solution-2)**

a-)

t(hour)	P (mm)	Δt(hour)	ΔP(mm)	i=ΔP/Δt (mm/hour)
0	0			
		1	6	6
1	6			
		1	4	4
2	10			
		1	5	5
3	15			
		1	3	3
4	18			
		1	6.5	6.5
5	24.5			
		1	2	2
6	26.5			
		1	1.5	1.5
7	28			
		1	1	1
8	29			

**b-)** Horton's expression for standard infiltration curve:

$f=f_c+(f_0-f_c)e^{-kt}$  (when the soil reaches the infiltration capacity, the value of infiltration rate is percolation.)

According to this:

$t=1 \Rightarrow f=2+(5-2)e^{-0.4*1}=4.01$  mm/hour

$t=2 \Rightarrow f=2+(5-2)e^{-0.4*2}=3.35$  mm/hour

$t=3 \Rightarrow f=2+(5-2)e^{-0.4*3}=2.90$  mm/hour

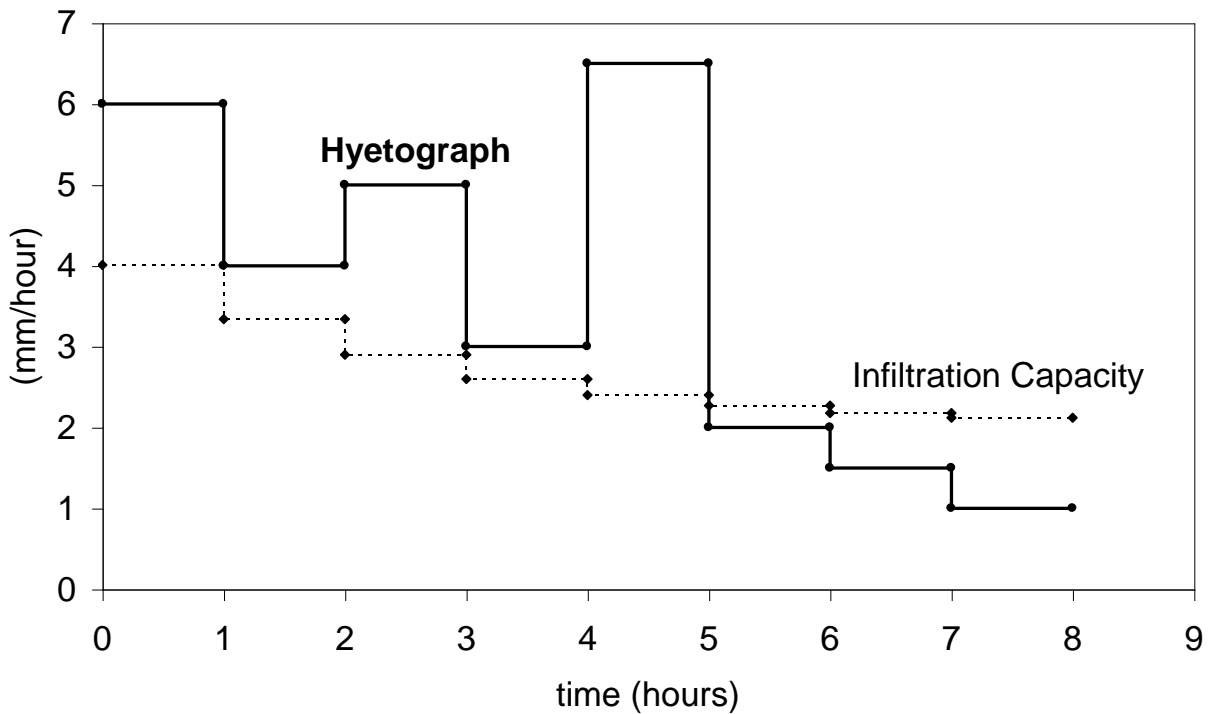

$t=4 \Rightarrow f=2+(5-2)e^{-0.4*4}=2.61$  mm/hour

$t=5 \Rightarrow f=2+(5-2)e^{-0.4*5}=2.41$  mm/hour

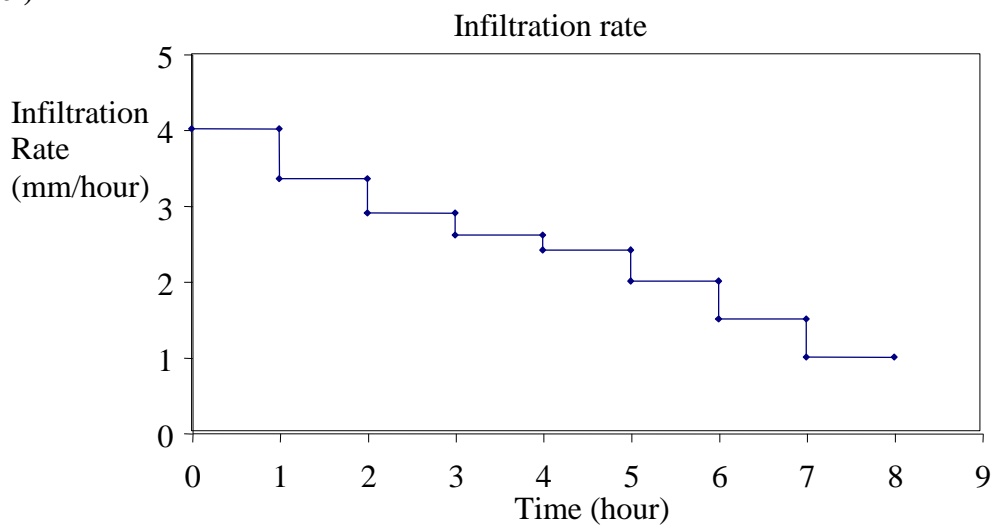

$t=6 \Rightarrow f=2+(5-2)e^{-0.4*6}=2.27$  mm/hour

$t=7 \Rightarrow f=2+(5-2)e^{-0.4*7}=2.18$  mm/hour

$t=8 \Rightarrow f=2+(5-2)e^{-0.4*8}=2.12$  mm/hour

**c-)**

**d-) Infiltration depth at 8<sup>th</sup> hour = the area under the inf. rate vs. time curve**

$$= F = 4.01 \times 1 + 3.35 \times 1 + 2.90 \times 1 + 2.61 \times 1 + 2.41 \times 1 + 2 \times 1 + 1.5 \times 1 + 1 \times 1 = 19.78 \text{ mm}$$

**e-) Total precipitation depth – infiltrated water depth = flow depth**

Precipitation Depth = P = the area under hyetograph

$$P = 6 \times 1 + 4 \times 1 + 5 \times 1 + 3 \times 1 + 6.5 \times 1 + 2 \times 1 + 1.5 \times 1 + 1 \times 1 = 29 \text{ mm}$$

So,

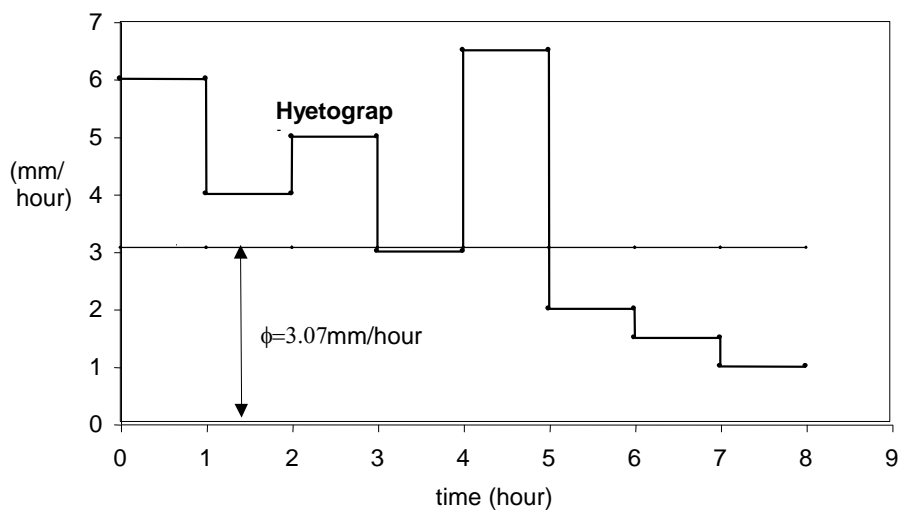

$$\text{Flow depth} = R = P - F = 29 - 19.78 = 9.22 \text{ mm}$$

**f-)**

### $\phi$ Index

We should search a value between the 3 mm/hour and the 4 mm/hour hour of the hyetograph to find out  $\phi$  index. So:

$$R = 9.22 = (6 - \phi) \times 1 + (4 - \phi) \times 1 + (5 - \phi) \times 1 + (6.5 - \phi) \times 1 \quad \text{and} \quad \phi = 3.07 \text{ mm/hour}$$

The graph is like:

### **W Index**

P: Prec. depth

R: Flow Depth

S: Surface Accumulation

$t_p$ : the duration when the prec. Intensity is higher than infiltration index.

$$W = \frac{P - R - S}{t_p} = \frac{29 - 9.22 - 0}{5} = 3.95 \text{ mm/hour}$$

$$\mathbf{W = 3.95 \text{ mm/hour}}$$
